

# JUNGLE OR JOY?

GET YOUR GARDEN IN TRIM AND  
WE'LL TAKE AWAY THE TRIMMINGS  
- OR TURN THEM BACK INTO  
GOOD USE FOR YOU.

TIME BASED RATES  
FROM AS LITTLE  
AS £25.00

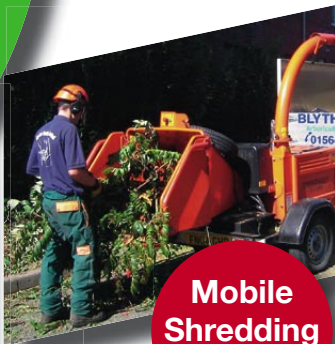

ABOUT HALF THE  
PRICE OF A SKIP FOR  
THE SAME AMOUNT  
OF GREEN WASTE

WHILE-YOU-WAIT RECYCLING  
FOR YOU TO USE - OR FOR  
US TO TAKE AWAY

NATURALLY GOOD FOR  
THE ENVIRONMENT

**Blythe Valley**  
Recycling Division

**Mobile  
Shredding  
Service**

## Your garden waste collected for recycling

No more messy trips to the tip and no more unsightly piles of garden rubbish left to rot away or burn late at night.

Let Blythe Valley come to your home to chip and shred your green waste. It's cheaper than hiring a skip, better than carting it to a land fill site or struggling to fill costly green bags: and it's ideal for making your own mulch or compost, if you choose to keep the residue.

See overleaf for the benefits you gain from recycling your garden waste.

# MULCH OR COMPOST? YOU'RE FREE TO CHOOSE.

Wood chippings used as a mulch around plants helps to keep in moisture and reduce weed growth. Composted green waste adds essential nutrients and encourages plant vitality when dug in and can also be used as a mulch.

## A true organic compost is not peat based

Organic compost comes from controlled, biological decomposition of organic material through the activity of aerobic (oxygen requiring) micro organisms, which generate heat, water vapour and carbon dioxide. When contained within optimum levels, these resources accelerate natural decomposition converting green waste into a sanitized, stable soil conditioner.

## Why is using organic compost so important?

Organic compost is an environmentally friendly product and an annually renewable resource. Amongst many benefits, it physically, chemically and biologically improves your soil through:

- Better soil structure.**
- Reduced compaction.**
- Added micro and macro nutrients.**
- Increased water infiltration and water holding capacity.**
- Increased soil aeration.**
- Reduced erosion and nutrient leaching.**
- Improved microbial activity.**
- Suppression of soil born diseases.**

All this is available just by composting your own green waste.

## Compost is essential for a healthy and abundant garden

**Mulching:** Spread a 5 - 7cm layer around trees, shrubs and flowers.

**Flower beds:** Apply a 2.5 - 5cm layer of compost to the soil and dig it in to about 15 - 20cm depth. Plant your seedlings, flowers shrubs then water well.

**Trees & Shrubs:** First dig a hole about 2/3 the depth of the root ball and at least twice as wide. Mix 1 part compost with 2 parts soil from the hole. Place the tree or shrub in the hole and apply the mixed soil around the root ball. Firm in the new plant and water well.

**New Turf:** Apply a 2.5 - 5cm layer of compost to the soil and mix in to a depth of 15 - 20cm. Sow the seed, then rake in and water.

**WHY NOT GET TOGETHER WITH NEIGHBOURS TO  
GET ALL YOUR GREEN WASTE SHREDDED.**
